PROFESSIONAL SUMMARY

Software engineer with 4+ years building React and TypeScript products. Part-time at Chief, an AI meeting assistant, I built the Claude Code pipeline that takes my Linear tickets to review-ready pull requests across the web app, desktop app, and Go backend. I merged 149 PRs there in my first three months and built the iOS and Android apps. Full-time at 24metrics, I started on the front end and now ship Go API changes too. Agents write most of my code. I read every diff before it ships.

EXPERIENCE

Software Engineer (Part-time), Chief (formerly Storytell)

June 2026 – Present

- Merged 149 pull requests in about three months, 25% of the engineering team's human-authored merges and second-highest on the team, across the web app, native desktop app, shared TypeScript libraries, and Go backend of an AI meeting assistant.
- Designed and maintain a personal AI agent pipeline on Claude Code (planner, coder, and tester subagents plus custom commands and skills for scoping, code review, browser checks, video proof, and review follow-up) that runs unattended in isolated git worktrees from Linear ticket to review-ready PR, and turns recurring reviewer feedback into rules the agents follow.
- Built native iOS (SwiftUI) and Android (Jetpack Compose) versions of the desktop app.
- Required proof of work on every PR: UI changes verified end to end in a real browser with Playwright and recorded as video; backend changes ship with captured terminal evidence.
- Own scope, final review, and merge decisions: clarify requirements with ticket owners, review every agent-drafted PR, and re-run end-to-end flows by hand when automated evidence is weak or inaccurate.
- Delivered features spanning SolidJS web UI, macOS native desktop code (meeting detection, tray menu, credits and billing, live sessions), and Go services (REST API, multi-tenant permissions, notifications, PostgreSQL migrations).

Software Engineer, 24metrics

March 2025 – Present

- Build React/TypeScript features from Figma for an ad fraud detection platform serving enterprise clients, and since Q3 2026 also ship Go API changes, working across front end and back end with AI agents.
- Designed the front end and back end specs, and wrote the documentation, for retargeting domains and tags for affiliate campaigns and for landing page URL templates (per advertiser plus an organization-wide global one).
- Built a Cursor workflow: skills that create Linear tickets and take them to a draft PR with screenshots, a developer agent whose rules come from real review comments, and a skill that renders documentation screenshots from the real UI with fictional data. Claude handles review and the harder tasks.
- Built and launched the company's WordPress site (Elementor, WP Rocket, custom PHP snippets).

Software Engineer, Booky

August 2022 – February 2025

- Developed and maintained React-based web and React Native mobile applications for a Philippines-based booking platform.

- Owned new user-facing features end to end, from component design to API integration, working with QA, design, and backend teams on a regular release cadence.
- Improved application performance and accessibility, reducing load times and addressing WCAG compliance across key user flows.

Software Engineer, PouchNation
January 2022 – May 2022

- Contributed to React-based frontend development for an event management and cashless payment platform.
- Implemented UI components and integrated REST APIs, supporting live event operations across physical venues.
- Rapidly onboarded into an existing codebase and delivered features independently within a fast-paced startup environment.

SKILLS

- **AI Engineering:** Claude Code (custom subagents, skills, slash commands), Cursor (skills, custom agents), multi-agent development workflows, MCP integrations (Linear, Slack, GitHub), prompt engineering, AI-assisted code review, GitHub Copilot
- **Frontend:** React, Next.js, SolidJS, SolidStart, React Native, TypeScript, JavaScript (ES2020+), HTML5, CSS3, Tailwind CSS, Material UI, TanStack Query, Vite, Webpack
- **Mobile:** SwiftUI (iOS), Kotlin and Jetpack Compose (Android), React Native
- **Backend & Native:** Go, Node.js, NestJS, Express, PostgreSQL, SQL migrations, REST APIs, Wails (Go desktop apps)
- **Testing:** Playwright (end-to-end and proof-of-work video), Vitest, Go testing, unit and integration testing
- **Tooling & DevOps:** Git, GitHub Actions, GitHub CLI, Docker, pnpm workspaces, Vercel, Netlify, Render, CI/CD pipelines, ESLint, Linear, Figma, WordPress / Elementor

PROJECTS

Outpost
outpost.luisgoyone.com
Engineering dashboard that pulls PRs, CI, deployments, and releases from all my GitHub repos onto one screen. Built with Next.js, TypeScript, the GitHub API, and GitHub Apps.

ParsePass
parsepass.luisgoyone.com
Shows what an applicant tracking system reads from a resume, then uses AI to rebuild it as a single-column, ATS-friendly version. An honesty check flags anything that wasn't in the original, and the export is read back to prove it parses. Built with Next.js, the Claude and Gemini APIs, pdf.js, and Playwright.

Lead Autopilot
leads.luisgoyone.com
AI inquiry handler for a demo dental clinic. It tags each inquiry, logs it to Google Sheets, emails a reply, alerts the owner, and holds urgent ones for approval. Built with Next.js, the AI SDK, Gemini, and Resend.

EDUCATION

Bachelor of Science in Information Technology
Saint Louis University | Cum Laude
